# What is an Embedded Network?

The Embedded Network is the on-site network of internal wiring and meters that distribute the electricity from the main supply point to the electricity users, such as the tenants and common areas. This network is usually owned and operated by the body corporate or the owner of the premise. By eliminating the need for the distributor to individually meter each tenant, the whole site is supplied by one connection from the local distribution network. The owner of the site becomes the customer of the distributor and the retailer, instead of previously where each tenant on the premise had an individual contract with the distributor and retailer.

Community Corporation 25624Inc. is the owner of the building.

Energy On is the Corporations Embedded Network Operator. **Energy On must be advised of all Suite/Lot Electrical connections and/or disconnections. This is the occupier's responsibility.**
